## purge a STATE in repository, 3GL available?

Author: ulrichmerkel@web.de (ulrich-merkel)

Sometimes,

form geometry runs out of control and we have to "reset" the state.

I think about a "reset form" button on each component,  
so we have \$componentname, \$applname and the uniface Version

Has someone already implemented  
a little 3GL magic to purge the registry entry  
and is willing to share it with us?

Uli

P.S. my client develops against uniface 9.3
