

Uniface 9: Open command Computername

Open command Computername

Author: roger.wallin@abilita.fi (rogerw)

Hi,

has someone been able to set the odbc-connection WSID from Uniface.

In other programming languages it's usually possible to set the WSID when initiating the connection "object". I suppose that this could be compared to what's done using "open" in Uniface.

If the WSID isn't set from the client-application the Computername is used. This is seen as the hostname in eg. Sql-Server sysprocesses-table/view (not sure about the table-name), which is usually seen by executing eg. sp_who.

| SPID | ECID | STATUS | LOGINAME | HOSTNAME | BLK | DBNAME | CMD | REQ_ID |
|------|------|--------|----------|----------------|-----|--------|------|--------|
| 55 | 0 | SLEEP | APLOWNER | SHARED MACHINE | 0 | APPLDB | wait | 0 |
| 56 | 0 | SLEEP | APLOWNER | SHARED MACHINE | 0 | APPLDB | wait | 0 |

Suppose that the computername is "SHARED MACHINE", that is what is seen by eg. sp_who. We would like to change this to "Roger on SHARED MACHINE", Roger being taken from a variable/table known by the client-session.

Is this a wish-candidate, or can it already be done in some way?

Regards RogerW.
