

# Uniface 9: \$componentname(v\_HANDLE)

## \$componentname(v\_HANDLE)

Author: i2stiller@gmx.de (istiller)

Hi freaks I just want to implement a few debugs into my component and output the componentname behind a (instance-)handle. Very easy task I thought. But UnifAce answered with a "nope, no way". A little bit of playing around and I got a solution: Instead of \$componentname(v\_HANDLE) just write \$componentname("%%v\_HANDLE%%") and voila, you got the wanted result. But - question to UnifAce - is this a official way to get the component behind a (instances-) handle? Ingo
