

# Uniface 9: Calling a Web page using UHTTP

## Calling a Web page using UHTTP

Author: cdouglass@siriussoftware.com.au (Colin)

Hi All, I have been asked to write a program that generates XML and then submits it to a website for processing. That process then returns the results to my program. I have no problem with generating the XML - it's easy using the UXMLWRITER facility. My problem is that I can't get the submit to work. Here is the example using LIBCURL I was given to base my code on The following is a cURL sample for DOS and may need slight modification for UNIX: REM sample curl call for Label Print Service curl -v -X POST -d@GenerateLabels.xml https://webapi.auspost.com.au/soap/LodgementManagement\_v1 --header "Content-Type: application/soap+xml;charset=UTF-8;action=\"generateLabel\"" --insecure --user lps\_merchant\_dev:LabelDev123\$ 2>out2.txt >out1.xml Here is my uniface code activate "UHTTP".SEND("https://webapi.auspost.com.au/soap/LodgementManagement\_MerchantTest\_v1", "POST", "userid", "password", "Content-Type:application/soap+xml;charset=UTF-8;action=%%\"generatelabel%%\"", v\_xmlcode, v\_response\_header) My generated XML is in v\_xmlcode. When I run this I get nothing. \$status is 0. \$proccerror is 0. The response in both v\_xmlcode and v\_response\_header is null. Its as if it was not executed in the first place (other than the variable v\_xmlcode being NULLed). I am obviously doing something wrong but I have no idea what. Any suggestions? Thanks in advance. Col.
