

Uniface 9: Uniface TabEx (How Form Container Lose Focus?)

Uniface TabEx (How Form Container Lose Focus?)

Author: lorenzo.are@gmail.com (lorenzo.arellano)

Hello, We're trying to use the TabEx widget and it works great!! We know that the TabEx has a Form Container or the capacity to open Contained Forms. We use some TabEx in the "Value Changed Trigger" with a simple selectcase: `selectcase tab case "things" newinstance "frmthings", "things" activate "things".Exec() form.dummy = "things" setformfocus "things" tab = "things" activate tab case "somethings" newinstance "frmsomethings", "somethings" activate "somethings".Exec() form.dummy = "somethings" setformfocus "somethings" tab = "somethings" activate tab case "otherthings" newinstance "frmotherthings", "otherthings" activate "otherthings".Exec() form.dummy = "otherthings" setformfocus "otherthings" tab = "otherthings" activate tab endselectcase` And it works good. The code can open contained forms. But when I have the focus in the new opened form (contained) always I have to press "esc" on keyboard to close the form and get the focus on the main form. Por example: if I need to press an other "Tab" for activate the Trigger "Value Changed" in my tab, I can't, 'cause I need press in first place the key "Esc" to close it. How can I fix that? How can I lose the focus from the contained form pressing the tab who has the "Selectcase"? Thanks a lot.
