

Uniface 9: Obtaining the Windows handle of a component

Obtaining the Windows handle of a component

Author: mrpetzl@hotmail.com (M Wilson)

Does anyone have a reliable way of obtaining the Windows handle of a Uniface component via code from within a Uniface application? It would be nice if this was available as a parameter via the component properties, or similar, but it isn't - I understand it would only be available via a 3GL call. Any ideas appreciated.
