

Uniface 10: get the content of the resource location in runtime (web)

get the content of the resource location in runtime (web)

Author: lammersma@hotmail.com (lammersma)

Hi all, In the web asn (runtime) there is a [RESOURCES] section. In this section the location of the resource files is defined. This can be a folder and/or url files. In my script I want to do some actions in these resource locations, search through these files and maybe even search in the content of these files. So I want to know all of these file locations. In my proccode/script I don't know the exact name of the asn files. This might make it slightly more complex :) I tried \$settings but it does not return anything I can use. It just returns a \$procerror -1118. I hope someone can help me further with this. Kind regards, Peter
