

# Uniface Flow: Reporting on UnifaceFlow

## Reporting on UnifaceFlow

Author: paul.chapelhow@b-plan.com (chapelhow)

Some of our customers like to use their 3rd party reporting tools on UnifaceFlow. However they have a problem with segmented fields in the UnifaceFlow tables. We have had requests to get particular data that is stored in these fields, in particular the values of Parameters that are passed in/out of the tasks (URELDATA field of UWPRCI). These parameters usually contain customer specific data which can help them identify tasks.

As I see it there are 2 options to satisfy this request:

1. Do not use segmented fields in runtime data.
2. Publish the schema model so that we are able to access the data required before it gets into the segmented fields, though with only the 4 current runtime tables I am not sure this is a valid solution?.
