

Uniface 9: [SOLVED] UPOPMAIL AND Windows Auth.

[SOLVED] UPOPMAIL AND Windows Auth.

Author: manfred.laterner@11er.at (mlaterner)

Hello everyone, we use UPOPMAIL to send Mails out of Uniface. The Problem is that our SMTP Server sends mails without authentication, we need to change that. And heres my Problem with NTLM and kerberos With the NTLM authentication it works - but not right... **NTLM** in my ASN_ [USER_3GL] usysbin:uauthntlm(UAuthNTLMSMTP) in Form/Service: variables*other variables* String vSecurityProperties String vSecurityParameters handle vUPopMail endvariables *a few other rows* vSecurityProperties = "SMTP=UAuthNTLMSMTP" vSecurityParameters = "DOMAIN=%domain\$%;USER=%user\$%;PASSWORD=%password\$%" vUPopMail->setSecurity(vSecurityProperties, vSecurityParameters) *Login > send > logoff* This works but we have to hard set a User/Password, who can write mails from all mailboxes like an exchange admin. because the mail-receiver should get the user mailadress as sender. And the SMTP dont accept for example User: Uniface.Mail From: mlaterner@Company.com because the user "Uniface.mail" can't send mails for the user "mlaterner" So we can't do this with NTLM . **Kerberos**

Example ASN addet row: usysbin:uauthsspi(UAuthSSPISMTTP) in Form: *same Variables* vSecurityProperties = "SMTP=UAuthSSPISMTTP" vSecurityParameters = "SSP=Kerberos.;SPN_SERVER=SmtSvc/MAILSERVER.company.com" *Login send* on the set security i get a "0" Status back but after Login -> here i get a "\$status -8 "

Uniface Help:

Security context could not be established.

Either the DriverParameters argument of the SetSecurity operation contained invalid keywords or data, or some protocol error occurred with the SMTP server.

Where is my problem? in my CMD when i type : setspn -I MAILSERVER i get a few rows and 2 of them are with SMTPSCV like in the uniface description: SmtSvc/MAILSERVER SmtSvc/MAILSERVER.company.at from my point of view it should work with there parameters but it don't.... or is there a simple/other way to use the Windows Login information (User/password/domain) without typing them to logon SMTP? Kind regards mlaterner
